Improving Relation Extraction by Pre-trained Language Representations Christoph Alt\*, Marc Hübner\*, Leonhard Hennig https://github.com/DFKI-NLP/TRE {firstname.lastname}@dfki.de

## Summary

**Current state-of-the-art** relation extraction methods typically rely on **lexical, syntactic, and semantic features, explicitly computed** in a pre-processing step, that require additional annotated language resources. This severely restricts the applicability and portability and introduces a source of errors. We introduce TRE, a Transformer for Relation Extraction, extending the OpenAI Generative Pre-trained Transformer [Radford et al., 2018]. TRE uses pre-trained deep language representations instead of explicit linguistic features and allows us to learn implicit linguistic features solely from plain text corpora by unsupervised pre-training, before fine-tuning the learned language representations on the relation extraction task. TRE obtains a new state-of-the-art result on the TACRED and SemEval 2010 Task 8 datasets.

## Goals

- High performance Relation Extraction
- No task specific architecture
- Limited pre-processing of source corpora
- Limited dependency on domain-specific resources

# Challenges

- Entity Masking is still crucial for best performance
- Overfitted language representations
- Hyperparameter tuning?

# The Task (Relation Extraction)

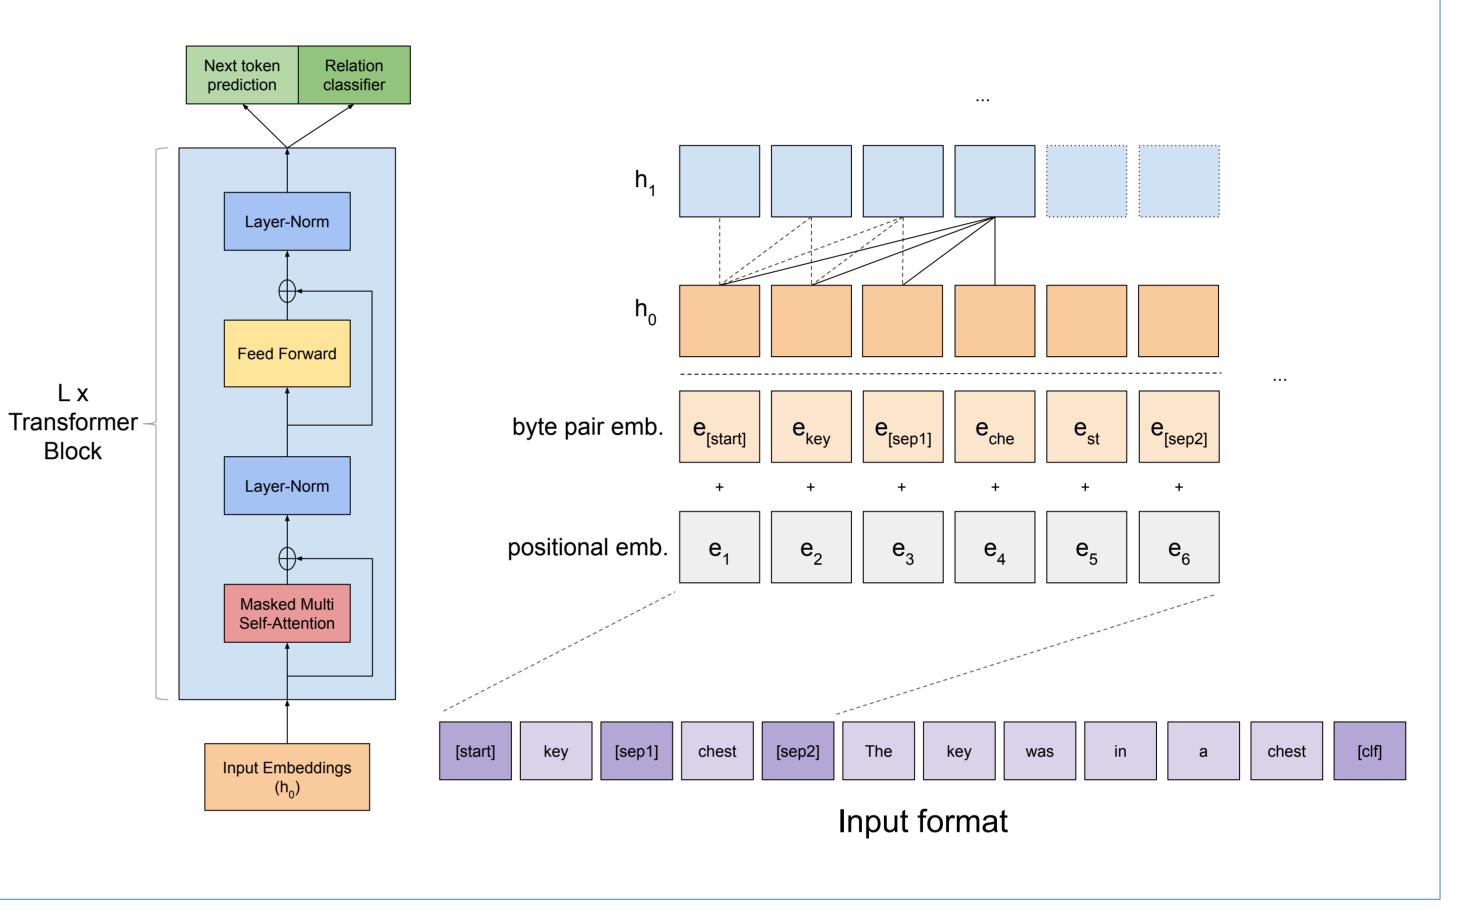

The following are typical inputs to a information extraction system:

<u>Mr. Scheider played the police chief of a resort town menaced by a</u> shark.

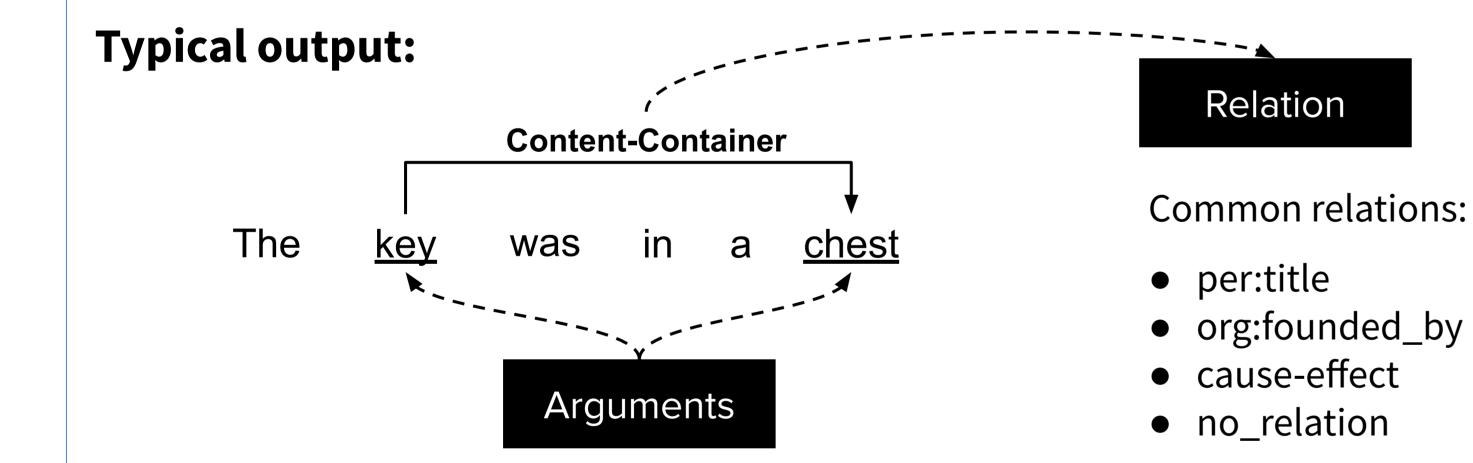

The measure included <u>Aerolineas</u>'s domestic subsidiary, <u>Austral</u>.

## **TRE Architecture**

Fine-tuned Transformer Language Model (OpenAI GPT) on a task-specific input format using multi-task learning with auxiliary loss as regularizer.

## The key was in a <u>chest</u>.

## Ablation

|                              | Sen  | nEval |      | TACRED |         |  |
|------------------------------|------|-------|------|--------|---------|--|
|                              | None | UNK   | None | UNK    | NE + GR |  |
| Best model                   | 85.6 | 76.9  | 63.3 | 51.0   | 68.0    |  |
| - w/o pre-trained LM         | 75.6 | 68.2  | 43.3 | 41.6   | 64.2    |  |
| - w/o pre-trained LM and BPE | 55.3 | 60.9  | 38.5 | 38.4   | 60.8    |  |

**Key Findings:** • Entity Masking helps for LM representation generalization • Without masking LM pre-training learns more generalizable representations for entities of both datasets

### Datasets

| Dataset             | <b>Relation Types</b> | examples | negative examples |  |  |
|---------------------|-----------------------|----------|-------------------|--|--|
| TACRED              | 42                    | 106,264  | 79.5%             |  |  |
| SemEval 2010 Task 8 | 19                    | 10,717   | 17.4%             |  |  |

TACRED relation types mostly focus on named entities, whereas SemEval contains semantic relations between concepts.

## **Entity Masking on TACRED**

| None | : The measure included <u>Aerolineas</u> 's domestic subsidiary, <u>Austral</u>    |
|------|--|
| UNK: | The measure included <u><unk></unk></u> 's domestic subsidiary, <u><unk></unk></u> |
| GR:  | The measure included <u><sub></sub></u> 's domestic subsidiary, <u><obj></obj></u> |
| NE:  | The measure included <u><org></org></u> 's domestic subsidiary, <u><org></org></u> |
|      |  |
|      |  |

| Entity Masking | Precision | Recall | F1   |
|----------------|-----------|--------|------|
| None           | 69.5      | 58.1   | 63.3 |
| UNK            | 56.9      | 46.3   | 51.0 |
| GR             | 63.8      | 50.1   | 56.1 |
| NE             | 68.8      | 65.3   | 67.0 |
| NE + GR        | 68.8      | 67.2   | 68.0 |

Results

| TACRED   |      |      |      |                            | SemEval |      |      |  |  |
|--|------|------|------|----------------------------|---------|------|------|--|--|
| System   | Р    | R    | F1   | System                     | Р       | R    | F1   |  |  |
| $\mathrm{LR}^{\dagger}$                        | 72.0 | 47.8 | 57.5 | $SVM^{\dagger}$            |         |      | 82.2 |  |  |
| $\mathrm{CNN}^{\dagger}$                       | 72.1 | 50.3 | 59.2 | $PA-LSTM^{\dagger}$        |         |      | 82.7 |  |  |
| $\mathrm{Tree}\text{-}\mathrm{LSTM}^{\dagger}$ | 66.0 | 59.2 | 62.4 | $C$ - $GCN^{\dagger}$      | _       |      | 84.8 |  |  |
| $PA-LSTM^{\dagger}$                            | 65.7 | 64.5 | 65.1 | $\mathrm{DRNN}^\dagger$    | _       |      | 86.1 |  |  |
| $C$ - $GCN^{\dagger}$                          | 69.9 | 63.3 | 66.4 | $\mathrm{BRCNN}^{\dagger}$ | _       |      | 86.3 |  |  |
| TRE (ours)                                     | 70.1 | 65.0 | 67.4 | TRE (ours)                 | 88.0    | 86.2 | 87.1 |  |  |

**Key Findings:** 

"None" masking delivers high precision but low recall

- Entity type information helps to generalize
- Additional Grammar masking further boosts performance
